OTHER THERMODYNAMIC PLANES

TWO PHASE SYSTEM (Liq+Vap):

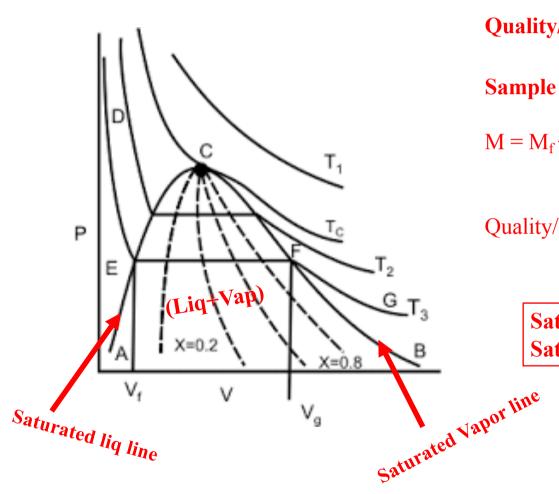

Quality/Dryness fraction (x)

Sample of two phase mixture

$$M = M_f + M_g$$
 $(M_f = Mass of liq, M_g = Mas of Vapour)$

Quality/Dryness fraction (x) =

- These properties are all dependent: specify one to determine all (because they are in a saturation state).
- Liquid and vapor phases coexist, the total mass of the mixture, m, is the sum of the liquid mass and the vapor mass: $m=m_f+m_g$, The ratio of the mass of vapor to the total mass is called the quality of the mixture: $x=m_g/m$

Source: Tables A-4 through A-8 are generated using the Engineering Equation Solver (EES) software developed by S. A. Klein and F. L. Alvarado. The routine used in calculations is the highly accurate Steam_IAPWS, which incorporates the 1995 Formulation for the Thermodynamic Properties of Ordinary Water Substance for General and Scientific Use, issued by The International Association for the Properties of Water and Steam (IAPWS). This formulation replaces the 1984 formulation of Haar, Gallagher, and Kell (NBS/NRC Steam Tables, Hemisphere Publishing Co., 1984), which is also available in EES as the routine STEAM. The new formulation is based on the correlations of Saul and Wagner (J. Phys. Chem. Ref. Data, 16, 893, 1987) with modifications to adjust to the International Temperature Scale of 1990. The modifications are described by Wagner and Pruss (J. Phys. Chem. Ref. Data, 22, 783, 1993). The properties of ice are based on Hyland and Wester, "Formulations for the Thermodynamic Properties of the Saturated Phases of H₂O from 173.15 K to 473.15 K," ASHRAE Trans., Part 2A, Paper 2793, 1983.
